요약(연구결과를 중심으로 개조식 500자이내)				보고서 면수	100

- 본 연구 사업은 남극세종과학기지 인프라를 활용 한국주도로 '남극해양생물다양성 및 기후변화' 관련 국제공동연구 기반 강화하는 한편 아시아극지과학포럼(Asian Forum for Polar Sciences, 이하 AFoPS) 회원국간 국제공동연구를 활성화시키기 위한 모델 제시를 목적으로 수행되었다.
- 연구 주제는 남극해양생물 중 가장 종 다양성이 높음에도 불구하고 분류정보는 매우 제한적 이어서 생태연구 등에 큰 걸림돌이 되고 있는 해양저서무척추동물에 대해 분류정보를 향상시키고자 말레이시아 전문가를 초빙(2015.4-6)하여 세종기지 주변해역에서 채집한 시료의 종 확인과 유전정보(Bar coding)를 확보하고자 하였다.
- 총 13 phyla, 243개체 1차 유전자 분석을 하여, 그 중 bar coding data가 없고 생태적으로 중요한 명게류(ascidians) 10여 종을 선정하고, 이들에 대해 정확한 종 기술을 위하여 형태분류 작업과 병행하여 3개유전자(18S rDNA, 16S rDNA, COI) sequences를 분석하였다.
- 추가적으로 한국극지자료센터 (Korea Polar Data Center, 'KPDC')에 등록할 시료 380점의 DB를 구축하였다.

색인어 (각 5개 이상)	한글	남극세종과학기지, 해양저서무척추동물, 명게류, 형태분류, 바코딩, 시퀀싱
	영어	Antarctic King Sejong Station, Marine benthic invertebrates, Ascidiants, Morphological identification, Bar coding, Sequencing

요 약 문

I. 제 목

AFoPS 회원국간 국제공동연구 활성화를 위한 세종기지 인프라활용 말레이시아와 시범연구

II. 연구개발의 목적 및 필요성

- AFoPS 회원국간의 국제공동연구 모델 제시
 - 남극세종과학기지 인프라 활용 한국주도 남극 해양생물 다양성 및 생태계 연구를 위한 국제공동연구 기반 강화
- 남극세종기지 주변 해역 서식 해양저서무척추동물 분류정보 향상
 - 남극해양저서무척추동물은 남극생물중 가장 생물다양성이 높음에도 불구하고 분류 정보는 매우 제한적, 생태연구 등 수행에 걸림돌

III. 연구개발의 내용 및 범위

- 세종기지 주변해역에서 수집한 해양저서무척추동물 시료에 대한 종다양성 및 분류 정보 향상
- 말레이지아 전문가를 초빙하여 공동연구

IV. 연구개발결과

- 총 13 phyla, 243개체 1차 유전자 분석(유전자 추출물 확보)
- 채집지역의 우점생물군인 명계류(ascidians)에 대해 형태분류 작업과 병행하여 3개유전자(18S rDNA, 16S rDNA, COI) sequences를 분석하였다. 최종 8종에 대해 종을 확인하고 bar coding을 확보함 (신규 등록 예정)
- KPDC 등록 추가 시료 380점의 DB 작성

V. 연구개발결과의 활용계획

- AFoPs 국가간 대형 국제공동연구 개발, 협력 주제 발굴에 활용
 - : (예) 마리안소만 해양생태계와 생물다양성 변화 연구
- 극지해양생물 시료 수집, 표본 관리 및 활용 연구
 - : (예) 국립해양생물자원관과 협의 및 공동연구개발 등
- 남극명계의 생물다양성과 진화 연구에 초석
- 기후변화영향 연구에 지표종으로 활용가치 크게 향상, 생태연구 진일보

S U M M A R Y

I. Title

Enhancement of international collaboration among AFoPs member countries using facilities at King Sejong Station: a case study with Malaysia

II. Purpose and Necessity of R&D

- Strengthening the foundation of international collaboration in the study of the global issue, 'Biodiversity of Antarctic Marine Biota and Impacts of Climate Changes' utilizing the King Sejong Station Infrastructure
- Providing 'a Model of a Collaborative Research' among AFoPS member countries

III. Contents and Extent of R&D

- Upgrading and refining information of taxonomy of marine benthic invertebrates collected from near-shore waters adjacent to the King Sejong Station
- Collaborative work with a Malaysian Scientist (by invitation)

IV. R&D Results

- DNA analysis on 13 phyla, 243 specimens
- Further sequencing of ascidians using 3 genes (18S rDNA, 16S rDNA, COI) and acquisition of bar coding of 8 ascidian species
- Confirmation of 8 ascidian species based on morphological identification
- Database of additional 380 specimens and 243 DNA extracts

V. Application Plans of R&D Results

- Expediting future development of collaborative studies among AFoPs member countries
- Providing a basis for the studies of ascidian diversity and evolution
- Advancing our knowledge on unknown Antarctic marine benthic species around King Sejong Station, and enhancing the utility of ascidians for climate related studies and for monitoring purposes

1. 연구의 필요성

가. 과학적 측면

- 남극세종과학기지 인프라 활용 AFoPS 회원국간의 국제공동연구 모델을 제시하고 한국주도 남극 해양생물 다양성 및 생태계 연구를 위한 국제공동연구 기반 강화
- 남극해양생물 중 가장 종 다양성이 높음에도 불구하고 분류정보는 매우 제한적이어서 생태연구 등에 큰 걸림돌이 되고 있는 해양저서무척추동물에 대해 분류정보를 향상시킬 필요가 있음.
- 특히 남극연안 해양저서무척추동물들은 기후변화의 지표생물종으로 적합, 따라서, 한국이 국제적으로 연구 흐름을 선도할 수 있는 독창성 있는 주제임.

나. 경제·산업적 측면

- 해당없음

다. 사회·문화적 측면

- 2013/2014 말레이시아와 최초로 수행된 공동연구에 이어, 후속연구로서 양국 간의 네트워킹 지속 강화
- 저비용으로 말레이시아 (UMT)의 신진과학자들의 역량을 최대한 활용, 우수연구성과를 생산, 양국간 국제협력 기반을 다지고 AFoPS 에서 한국의 입지 강화

2. 국내·외 연구현황

가. 국외 현황

- 남극 해양저서무척추동물의 경우 현재 약 7,000 종 확인. 극히 일부 (~5%)만이 Bar coding 완성. 미확인 수 만 종 임 (Grant & Linse 2009, Gutt et al. 2010, Broyer et al. 2011; Grant et al. 2011, www.scarmarbin.org, www.marinespecies.org/rams)
- 남극 연안 해양생물다양성에 대한 체계적 연구가 거의 없음
- 주로 하계기간에 연구, 계절변동에 따른 생태특성 밝혀진 것이 극히 일부 종에 국한

나. 국내 현황

- 극지연구소에 남극대형해양저서무척추동물 표본 700여점 KPDC에 등재

- 형태분류에 의존, 정확한 종 동정이 이루어진 것은 약 10%에 불과, Bar coding 전무
 - 세종기지 주변해역 서식 4종의 산호류 형태 분류 (송준임 등, 2012)
 - 마리안소만 빙하후퇴에 따른 연안해양저서생물군집 다양성 변화 평가 (Universiti Malaysia Terengganu (UMT)- Dr. WMR Wan Hussin)와 공동연구(2013/2014) (Moon et al. 2015)

다. 현 기술의 취약성

- 극지연구소 소장 남극해양저서무척추동물 표본 분류에 대한 국내전문가 극소수
- 월동연구가 거의 없음. 특히 조간대 주요생물종의 생활사, 월동전략, 군집변동, 먹이 그물 등 거의 밝혀지지 않음.

3. 연구개발 목표 및 내용

가. 최종목표

- 남극세종과학기지 인프라활용 글로벌이슈 '남극해양저서생물 다양성 및 기후변화 영향' 국제공동연구 기반 강화
- AFoPS 회원국간의 국제공동연구 모델 제시

나. 연구소 기능 및 비전, 중기전략계획 등과의 연계성

- 제2차 남극연구활동기본계획 (12~16)에 명시한 연구소 충점과제의 하나인 '글로벌 이슈대응을 위한 남극 기후변화 연구'에 부합
- 동 기본계획에 주요과제인 남극활동 국제협력 기반 강화를 위한 실질적 시도. 특히 AFoPS 회원국인 말레이시아와의 시범연구로 국제공동연구 모델을 제시하고 우리나라 입지 강화

다. 연차별 연구개발의 목표 및 내용

1) 정성적 목표

(단위 : 천원)

구분	년도	연구개발목표	연구개발내용	연구범위
1차년도	2014. 9. 1 ~ 2016. 4. 30	세종기지 해양저서무척추 다양성 분석 (현재 10%수 준의 종분류를 15% 수준 으로 올림) [SCI 논문 1편 계재]	KPDC DB 시료 추가 구 축, 형태 분류 및 bar coding 작업 우선 분류군 선정 · 분석	KPDC DB 시료 우선 분석, 말레이시아 전문 가 초청 시료 유전자 분 석 및 국내전문가 자문 으로 형태분류 진행

2) 정량적 목표

(단위 : 건)

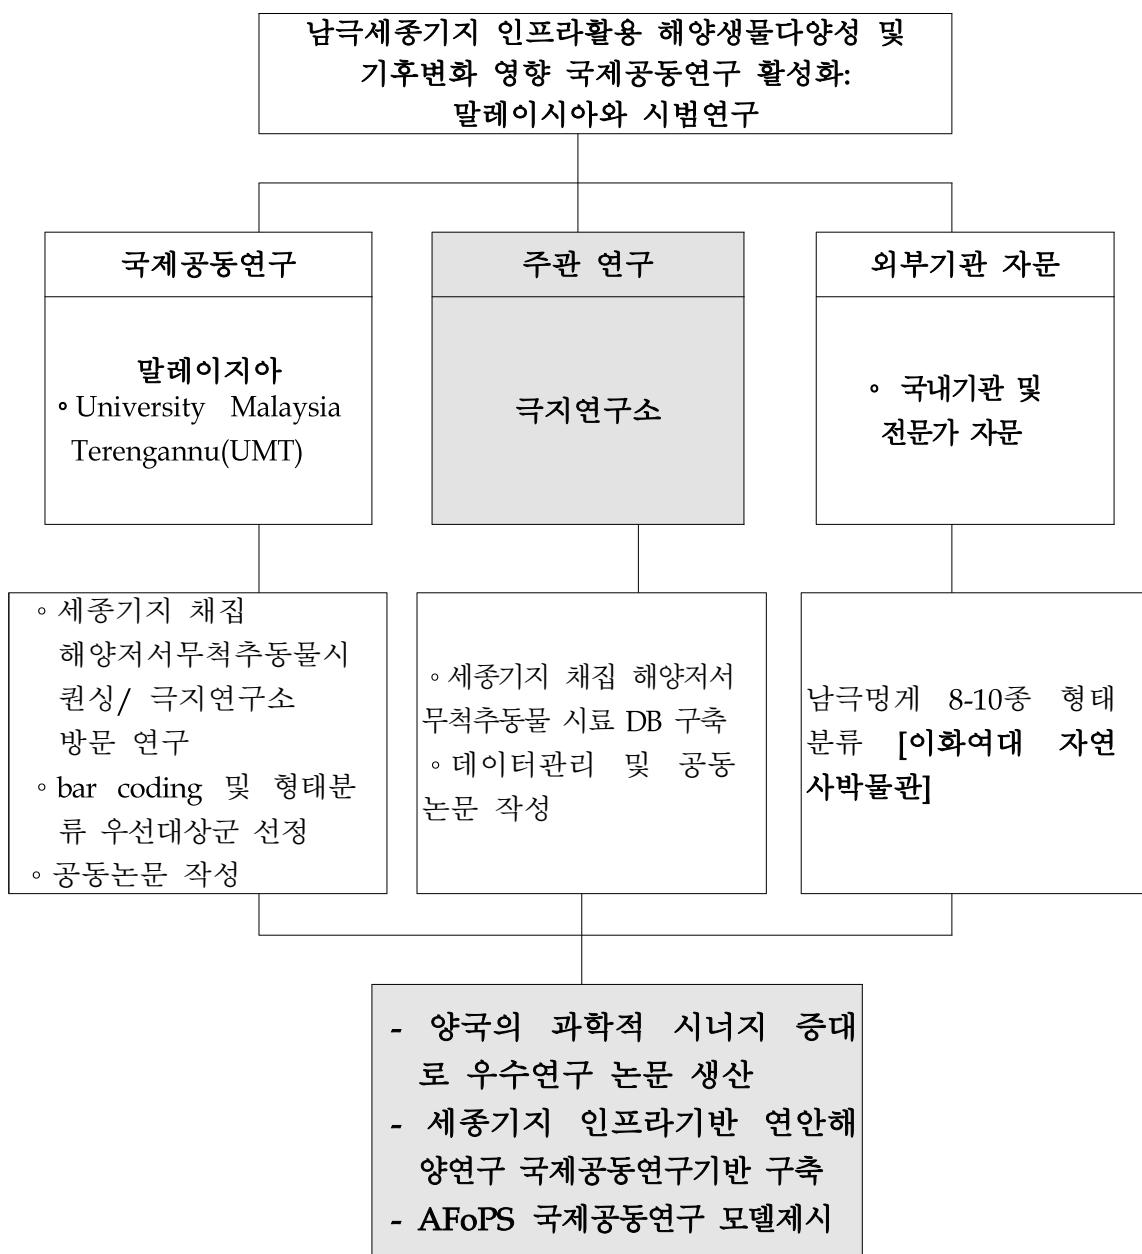

구분	국외논문		국내논문		특허출원		기타
	SCI	기타	SCIE	기타	국외	국내	
1차년도	1						
과제종료후							국제학술 발표 (2016. 8 SCAR OSC at Malaysia)

라. 연구평가의 착안점 및 척도

구분	년도	세부연구목표	가중치	* 평가의 착안점 및 척도
사업 수행기간	2014. 9 - 2016. 4	세종기지 해양저서무 척추 다양성 조사 세종기지 채집 시료 유전자분석 및 bar coding 우선 분류군 선정 · 분석	50 % 50 %	수집 표본 KPDC 추가 구축 10개종 이상 barcoding, KPDC 표 본 종수준 분류 15% 이상 향상 [SCI 1편 이상 게재]

4. 연구개발 추진체계 및 방법

가. 추진체계

나. 연구개발 수행방법

- (1차) 세종기지 채집 해양저서무척추동물 DB 구축 (극지연구소) 및 시퀀싱 (말레이지아 전문가 초빙 연구)
- (2차) 시퀀싱후 Bar coding data가 없고 생태적으로 의미가 있는 분류군 (명계류) 선정
- (3차) 이대 자연사박물관에 명계류 10여 종 형태 분류 의뢰

다. 추진일정

연구내용	추진일정					
	'14/ 4분기	'15/ 1분기	2분기	3분기	4분기	'16/ 1분기
문헌조사 및 정보수집						
세종기지 채집 해양저서무 척추동물 유전자 분석 (말 레이지아 과학자 연구소 방 문 연구)						
세종기지 채집 해양저서무 척추동물 표본 분류작업, DB 구축						
데이터 분석 및 논문 작성						
선별시료 (명계 10여종) 형 태분류 자문						
사업진도(%)	30		50		100	

5. 연구 결과

가. 유전자 분석

- 총 13 phyla, 243 개체에 대해 3개유전자(18S rDNA, 16S rDNA, COI) sequence 분석
(도표 1)(부록 1-분석결과)

<도표 1: 유전자 분석에 사용된 해양저서무척추동물 분류군>

나. Barcoding 우선 분류군 선정

- 채집지역의 우점생물군인 명게류(ascidians)에 대해 형태분류 작업과 병행
- 8종 이상에 대해 종을 확인하고 bar coding 신규 등록 예정 (사진 1)

다. KPDC 등록 DB 작성

- 추가시료 381점 (No. 740 ~ No. 1120) DB 구축 (부록2)
- 시료 ID, 표본관리자, 분류군명, 채집일자 및 장소, 보존상태 등 기록(사진2-시료보관장)

<사진2: 극지연구소에 보관중인 세종기지 채집 해양저서무척추동물 시료>

라. 논문 (SCI 1편) 초안 작성 (부록3)

<사진 1: 세종기지 채집 명계류. 마리안소만과 인근 해역에 우점종으로 다양한 종이 서식하고 있다>

1. Ascidiacea sp. 1 *Molgula pedunculata* (fairly translucent with a long stalk or peduncle, solitary, the most common)

2. Ascidiacea sp. 2 *Pyura setosa* (surface completely covered with flexible bristles)

3. Ascidiacea sp. 3 *Pyura georgiana* (bean-shaped with a long stalk)

4. Ascidiacea sp. 4 (분석중) (translucent, smooth surface, without stalk)

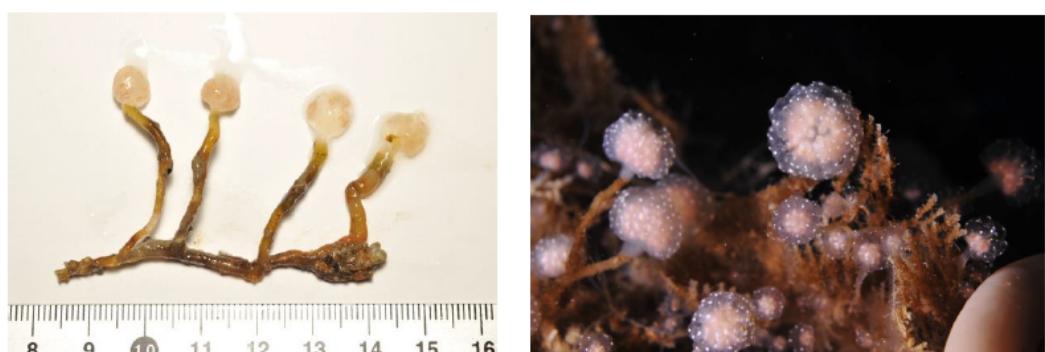

5. Ascidiacea sp. 5_ *Cnemidocarpa verrucosa* (yellowish to brown, translucent, cylindrical, covered with protuberances)

6. Ascidiacea sp. 9 (분석종)

7. Ascidiacea sp. 10_(분석종) (colonial, pinkish & translucent, cotton-ball shaped)

8. Ascidiacea sp. 14_ *Ascidia challengerii* (orange to translucent, tough leathery outer layer)

6. 기대성과 및 활용방안

가. 기대성과

(1) 과학·기술적 측면

- 남극해양저서무척추동물 다양성에 대한 새로운 정보 제공으로 남극과학에 기여
- 종의 확인 뿐 아니라, 남극멍게의 생물다양성과 진화 연구에 초석
 - 기후변화영향 연구에 지표종으로 활용가치 크게 향상, 생태연구 진일보

(2) 경제·사회적 측면

- 국제공동연구를 통한 극지인프라 공동활용으로 2개 남극상주기지운영 명분강화
- AFoPS 주요 국가들과의 협력 강화를 통한 우리나라 입지 강화
- 양국가 전문가들의 과학적 시너지 증대로 우수연구성과 창출 기대

나. 활용방안

- 향후 AFoPs 국가간 대형 국제공동연구 개발, 협력 주제 발굴에 활용
- 극지해양생물 시료 수집, 표본 관리 및 활용 연구
 - 국립해양생물자원관과 공동연구개발 등

7. 참고문헌

31
32 **Introduction**

33
34 Antarctica is one of the most remote and pristine regions in the world. Most of
35 the marine organism, particularly the sessile benthic fauna, makes up the majority of
36 the Antarctic fauna (Clarke and Johnston 2003). Ascidiants are the most abundant
37 benthic communities found below 20 m in the Southern Ocean (Tatián et al. 1998;
38 Gutt et al. 2010). Due to their distribution in the isolated Antarctica, their
39 susceptibility to any climate-induced changes is inevitably high. Physical disturbance
40 from iceberg scouring and collapse may seriously crushed the bottom substrates and
41 destroy benthic communities (Gutt et al. 2013; Moon et al. 2015). The sudden
42

43 increase of glacial melt water loaded with terrestrial sediments may also alter seabed
44 structure and composition, thus impacting the spatial distribution and biodiversity
45 level of shallow nearshore inhabitants such as ascidians (Pabis et al. 2011; Moon et al.
46 2015). With the rising extinction rates, relying solely on conventional taxonomy in
47 resolving species identification would be too late to discover unknown species before
48 they become extinct. Therefore, there is an urgent incentive to increase biological
49 monitoring by expediting species discovery for species remains to be identified.

50 Currently, out of 2,815 ascidian species from 26 families in the class of
51 Ascidiacea, only 107 Antarctic species have been recorded in the Ascidiacea World
52 Database (Shenkar and Swalla 2011). Recent phylogenomic study has indicated that
53 ascidians from the phylum Chordata, are invertebrates with the closest relationship to
54 vertebrates (Delsuc et al. 2006). In the Antarctica, 58% of ascidians species are solitary
55 and they are also claimed to be predominantly endemic to the Southern Hemisphere,
56 with modified morphological features and biological functions adapted to survive in
57 the harsh winter condition (Primo and Vazquez 2009). They have unique stalk
58 structure, which enables them to grow vertically on soft sediments (Tatian et al. 1998)
59 and also to improve their food captivity process (Gili et al. 2001).

60 Although ascidian species collected from the Antarctica continent have been
61 recorded since 1873 following several major expeditions which begun with the
62 “Challenger Expedition”, most specimens were only briefly described, hampering
63 routine scrutiny effort for most benthic taxonomist today. High morphological
64 variability in the shape, size and color caused by genetic characteristics and local
65 environmental conditions (Dias et al. 2009) makes species identification of ascidians
66 notoriously difficult. Lack of morphological details and synonymy in ascidians
67 species further complicates their identification process and hamper the expansion of
68 taxonomic knowledge and their biodiversity. Misidentification of ascidian species is
69 common as their classification are mostly based on inner morphological characters
70 such as gonad or gut loop shape and positions, and branchial sac structures (Monniot
71 et al. 1991; Mastrototaro and Dappiano 2008; Lambert 2009). In the case when
72 conventional morphological keys are not feasible enough for species identification,
73 DNA sequences offers a good complementary aid for morphological approach in
74 achieving high species discrimination accuracy (Geller et al. 2010). However, both
75 approaches need to be integrated and work hand in hand for modern taxonomy study.

76 The lack of reference sequence for Ascidians in the molecular repositories is
77 one of the biggest challenges in validating the species in our study. The severe lack
78 of molecular data for Antarctic benthic still continues today even though many
79 sequences for other Antarctic taxonomic groups have been generated as part of the
80 Census of Antarctic Marine Life (CAML) efforts (Grant et al. 2011; Dettai et al.
81 2011). Despite massive sampling expedition, the availability of sequences for marine
82 invertebrates remains scarce in the public domain since 2009 (Grant and Linse 2009).
83 In fact, most of the deposited sequences were dominantly obtained from specimens
84 collected at restricted regions in the Southern Ocean, which include Antarctic
85 Peninsula, the Dumont D’Urville, Weddell and Ross seas. Therefore, development
86 and deposition of many reference sequences will be necessary before further routine
87 species identification can be conducted. Our study will be a pilot study, which
88 includes an extensive description of morphological features of Antarctic ascidians in
89 King Sejong station accompanied with DNA sequences comprised of three genes. We
90 have also highlighted the systematic position and dated the divergence times of each
91 studied species within the class of Ascidiacea. We aimed to fill up the taxonomic gaps,
92 by clarifying the taxonomic status and re-examine the morphological features in

93 specimens collected in this region, which eventually adds up to the list for the genetic
94 inventory of the Southern Ocean.

95

96 **Material and Methods**

97

98 **Sample Collection**

100 Ascidians specimens were collected by SCUBA diving along transect lines spanning
101 15 to 30 m depths at three stations in Marian Cove (MC2, MC3 and MC4) from Dec.
102 9th 2013 till Jan 29th 2014. All the specimens were sorted out and photographed before
103 fixation. For morphological identification, specimens were fixed in 4-5% formalin
104 with seawater or preserved in the 100% ethanol. Tissue samples from each specimen
105 were also preserved in absolute ethanol for molecular genetic analysis. Voucher
106 specimens for all species in this study are held in the Korean Polar Research Institute
107 (KOPRI), University of Science and Technology, Incheon, Korea (**Table 1**).

108 **Morphological Study**

109
110
111
112
113
114
115

116 **DNA extraction, amplification and sequencing**

117 Total genomic DNA was isolated from tissue samples using QIAamp ® DNA Mini
118 and Blood kit (QIAGEN, CA, USA) according to the manufacturer's protocols, but
119 with slight modification. Targeted genes were amplified using primer pairs listed in
120 **Table S1**. Polymerase chain reactions were performed in a total mixture volume of 20
121 µl containing 1x PCR Buffer (Takara Bio Inc.), 2.5mM MgCl₂, 1mM of each dNTP,
122 5pmol of each primer, 5U of Taq Polymerase (2.5 U of Taq Polymerase for
123 cytochrome oxidase I) and 100 ng template DNA. Thermal cycler conditions for each
124 gene were as follows: **18S rDNA**, initial denaturation at 94 °C for 2 min, 35 cycles of
125 94 °C for 45 s, 53 °C for 50 s, 72 °C for 55 s, followed by a final extension step at
126 72 °C for 7 min; **16S rDNA**, initial denaturation at 94 °C for 2 min, 35 cycles of
127 94 °C for 30 s, 50 °C for 30 s, 72 °C for 1 min, followed by a final extension step at
128 72 °C for 7 min; **COI**, 35 cycles of 95 °C for 1 min, 49 °C for 1 min, 72 °C for 1 min
129 30s and ended with an elongation step of 72 °C for 7 min. PCR amplicons were gel
130 purified using Wizard® SV Gel and PCR Clean-Up System (Promega BioSciences,
131 LLC, USA). Purified PCR products were sequenced bi-directionally on an ABI Prism
132 3700 automated sequencer using commercial service of macrogen (Seoul, Korea).

133 **Molecular Phylogenetic Analysis**

134 All sequences were manually assembled and trimmed using CodonCode Aligner
135 (CodonCode Corporation, USA) and SeqMan Pro (DNASTAR, Inc., USA). The
136 edited sequences were the first set of sequences representing all the species submitted
137 to GenBank. The accession numbers of all new sequences generated in this study is
138 listed in **Table 1**. Additional sequences retrieved from GenBank for other genera were
139 also used to generate consensus sequence representing each species for phylogenetic
140 reconstruction (**Table S2**). Due to absence of geological calibration point information
141 related with ascidians, we have adopted Bayesian approach using a generalized clock
142 to estimate time of divergence for the Antarctica specimens. Following jModelTest

143 2.1.3 (Darriba et al. 2012), HKY model of sequence evolution was selected for
144 subsequent times of divergence estimation. We used an uncorrelated lognormal
145 relaxed molecular clock model (standard deviation of the uncorrelated lognormal
146 molecular clock rate for both partitions >1.0) and a Yule tree prior. Two runs,
147 consisting of 20,000,000 generations each and sampling every 1,000 generations,
148 were performed using BEAST version 1.8.2 (Drummond et al. 2012). Estimated times
149 to the most recent common ancestor (MRCA) was assessed from both runs using
150 Tracer 1.6 (Drummond et al. 2012) as mean values in million years (Ma) with 95%
151 highest and lowest posterior density intervals (HPD). A maximum credibility tree
152 with annotated node ages was calculated with TreeAnnotator v 1.8.2 (part of the
153 BEAST package) and visualized using FIGTREE v. 1.4.2 (Rambaut 2014).

167

168 **Species Delimitation**

169

170 Our sequence showed no match with any of the neither 18S rDNA reference sequence
171 in GenBank nor BOLD sequences. These discrepancies are largely due to the absence
172 of sequence data for our targeted species.

173

174

175

176 **Discussion**

177

178 Currently, there are four *Corella* species found in the Antarctic: *Corella antartica*
179 (Sluiter 1905), *C. eumyota*, *C. dohrni* and *C. benedeni* (Van Beneden and de Selys
180 Longchamps 1913). Due to their similar morphological features, their synonymy
181 leads to imprecise species identification. In fact, *Corella antarctica* Sluiter
182 (1905) has long been considered a junior synonym to *C. eumyota*. Therefore, the high
183 similarity (99%) for COI sequences for both of these species should be anticipated
184 given that the morphological characters traditionally used to identify the *C. eumyota*
185 is unable to accurately delimitate this species from its congeners. The vague
186 morphological keys fail to adequately differentiate both species, which led to the
187 taxonomic confusion presented here.

188

189 Whilst barcoding work is technically straightforward for most taxa groups,
190 this is not always the case for less well-studied taxa. Acquisition of sequences
191 becomes the first hindrance even multiple pairs of primers have been used. Technical
192 problems arose from amplifying and sequencing COI such as in some species in our

193 study for both COI and 16S rDNA genes have proven the difficulty of using
194 molecular data alone to delimitate ascidians species. Most of the sequences deposited
195 for ascidians is of non-COI data and from the nuclear region, 18S rDNA. The same
196 result has also been observed in larger barcoding project in which only a minority of
197 collected ascidian species was successfully barcoded (Dettai et al. 2011). Monniot et
198 al. (2011) indicated that composition biases and poly-Ts in a number of species have
199 intensified the difficulty of COI sequencing. Besides, the fast-evolving nature of
200 ascidians has also increased the challenges in retrieving reliable amplified sequences
201 which further complicates the usage of molecular characters to infer their
202 evolutionary relationship (Delsuc et al. 2006; Rubinstein et al. 2013).

203

204 The presence of cryptic species was reported to be common features for many
205 Antarctica marine taxa. Molecular techniques have discovered high numbers of
206 morphologically indistinguishable species with deep intra-specific divergence
207 (Allcock et al. 1997; Linse et al. 2007; Wilson et al. 2007; Hunter and Halanych 2008;
208 Krabbe et al. 2010; Branda˜o et al. 2010). The high intra-specific diversity for the
209 same species in XXXX, suggested the presence of cryptic species in XXXX within
210 this region as previously documented for *Pyura bouvettensis* (Dettai et al. 2011) and
211 *Limacina helicina* (Hunt et al. 2010). Larger amount of specimens need to be
212 investigated to assess intra-specific variation.

213

214 While the sequences from our study represents only a few specimens from a
215 small region in the Southern Ocean, the integrated conventional and molecular
216 taxonomy could serve as useful reference for population and other evolutionary
217 related studies. Besides elucidating the taxonomy, these data offers the most optimal
218 way in recording and protecting the ascidians biodiversity in the Antarctic, including
219 many more species that are yet to be discovered.

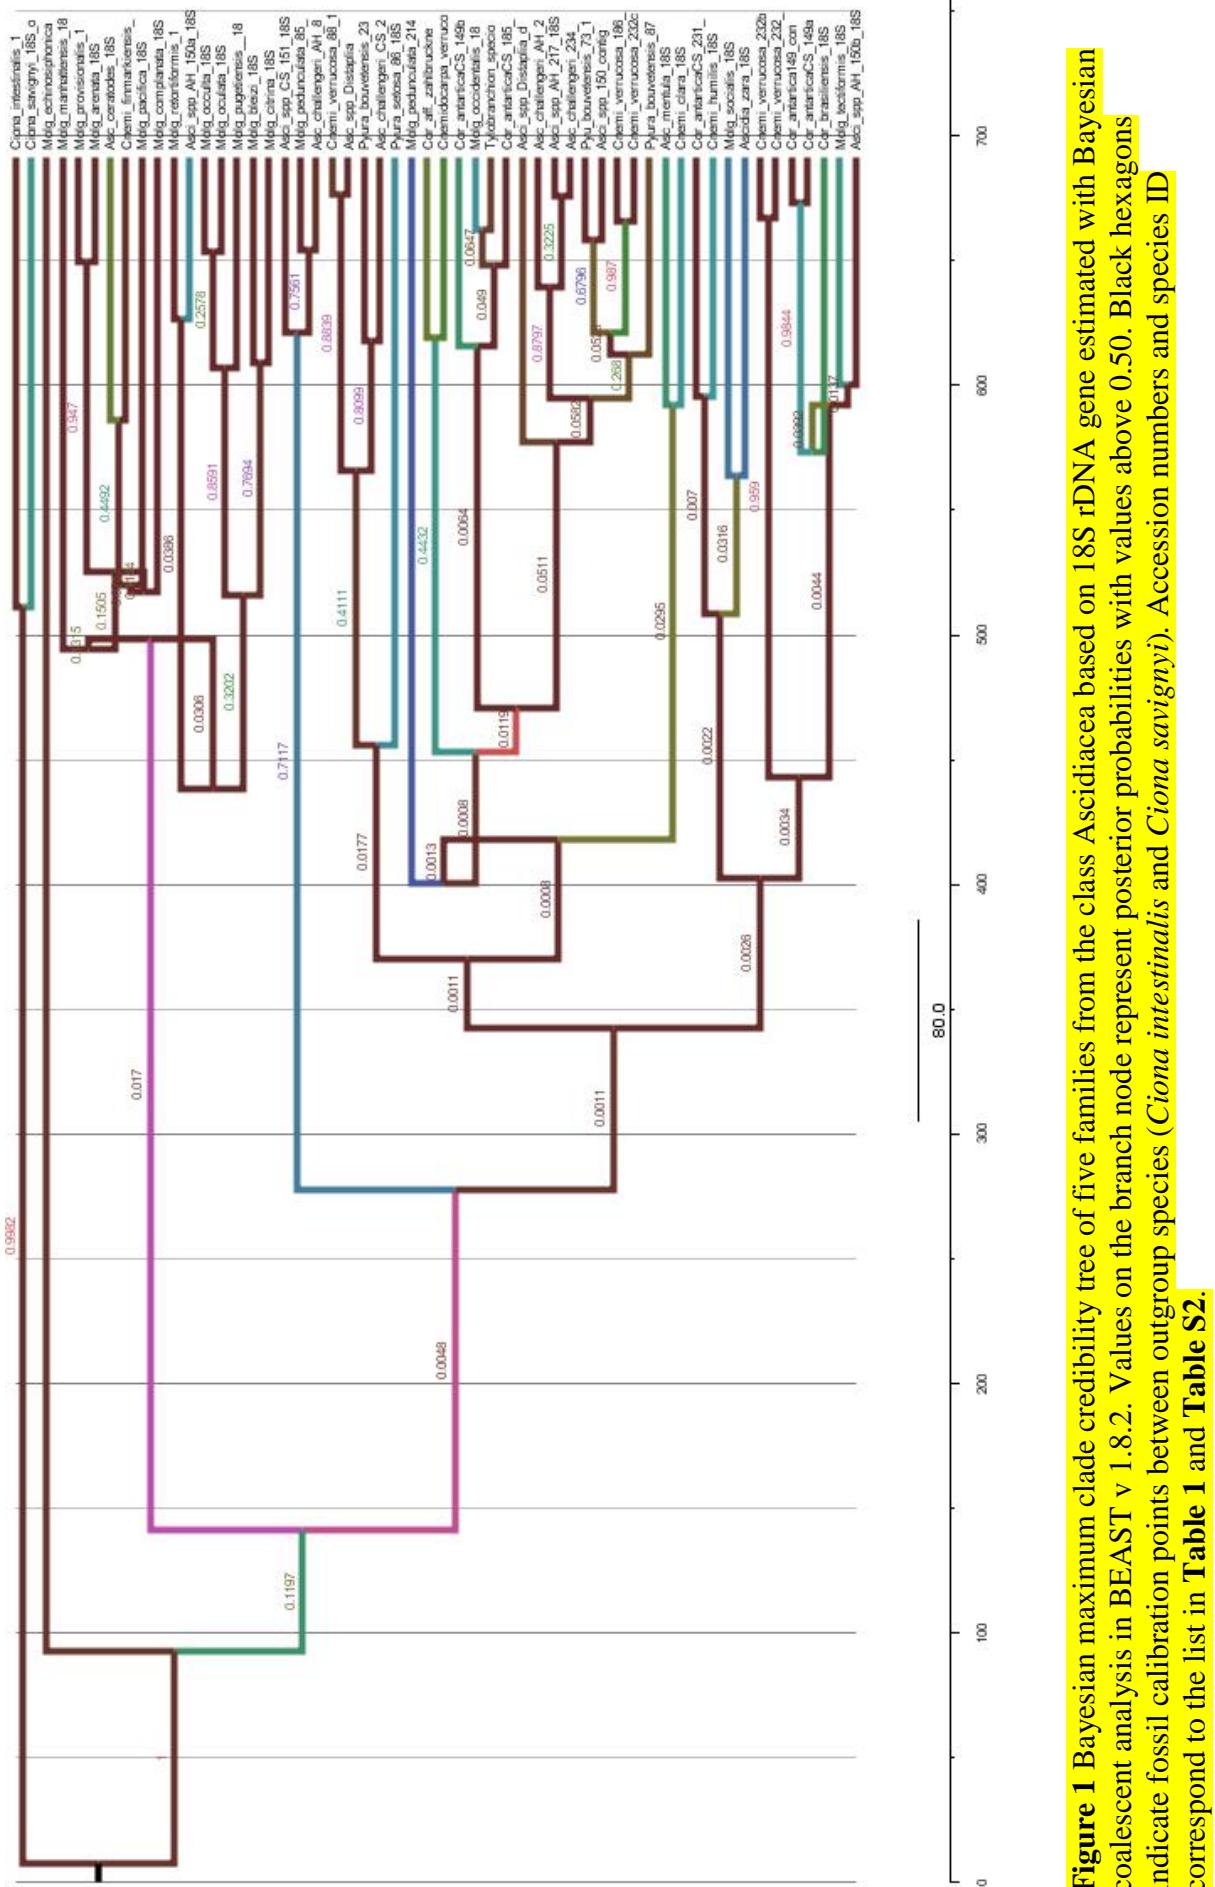

Figure 1 Bayesian maximum clade credibility tree of five families from the class Ascidiacea based on 18S rDNA gene estimated with Bayesian coalescent analysis in BEAST v 1.8.2. Values on the branch node represent posterior probabilities with values above 0.50. Black hexagons indicate fossil calibration points between outgroup species (*Ciona intestinalis* and *Ciona savignyi*). Accession numbers and species ID correspond to the list in Table 1 and Table S2.

Table S1 Primers used for amplification and sequencing of the 18S rDNA, cytochrome oxidase subunit I (COI) and 16S rDNA genes

Gene	Primer Name	Sequence 5'-3'	Source
18S rDNA	18S-TF	F: AAA CGG CTA CCA CAT CCA AG R: AAC TAA GAA CGG CCA TGC AC	Carreras-Carbonell et al. (2005)
